

The Strangest Creatures on Earth

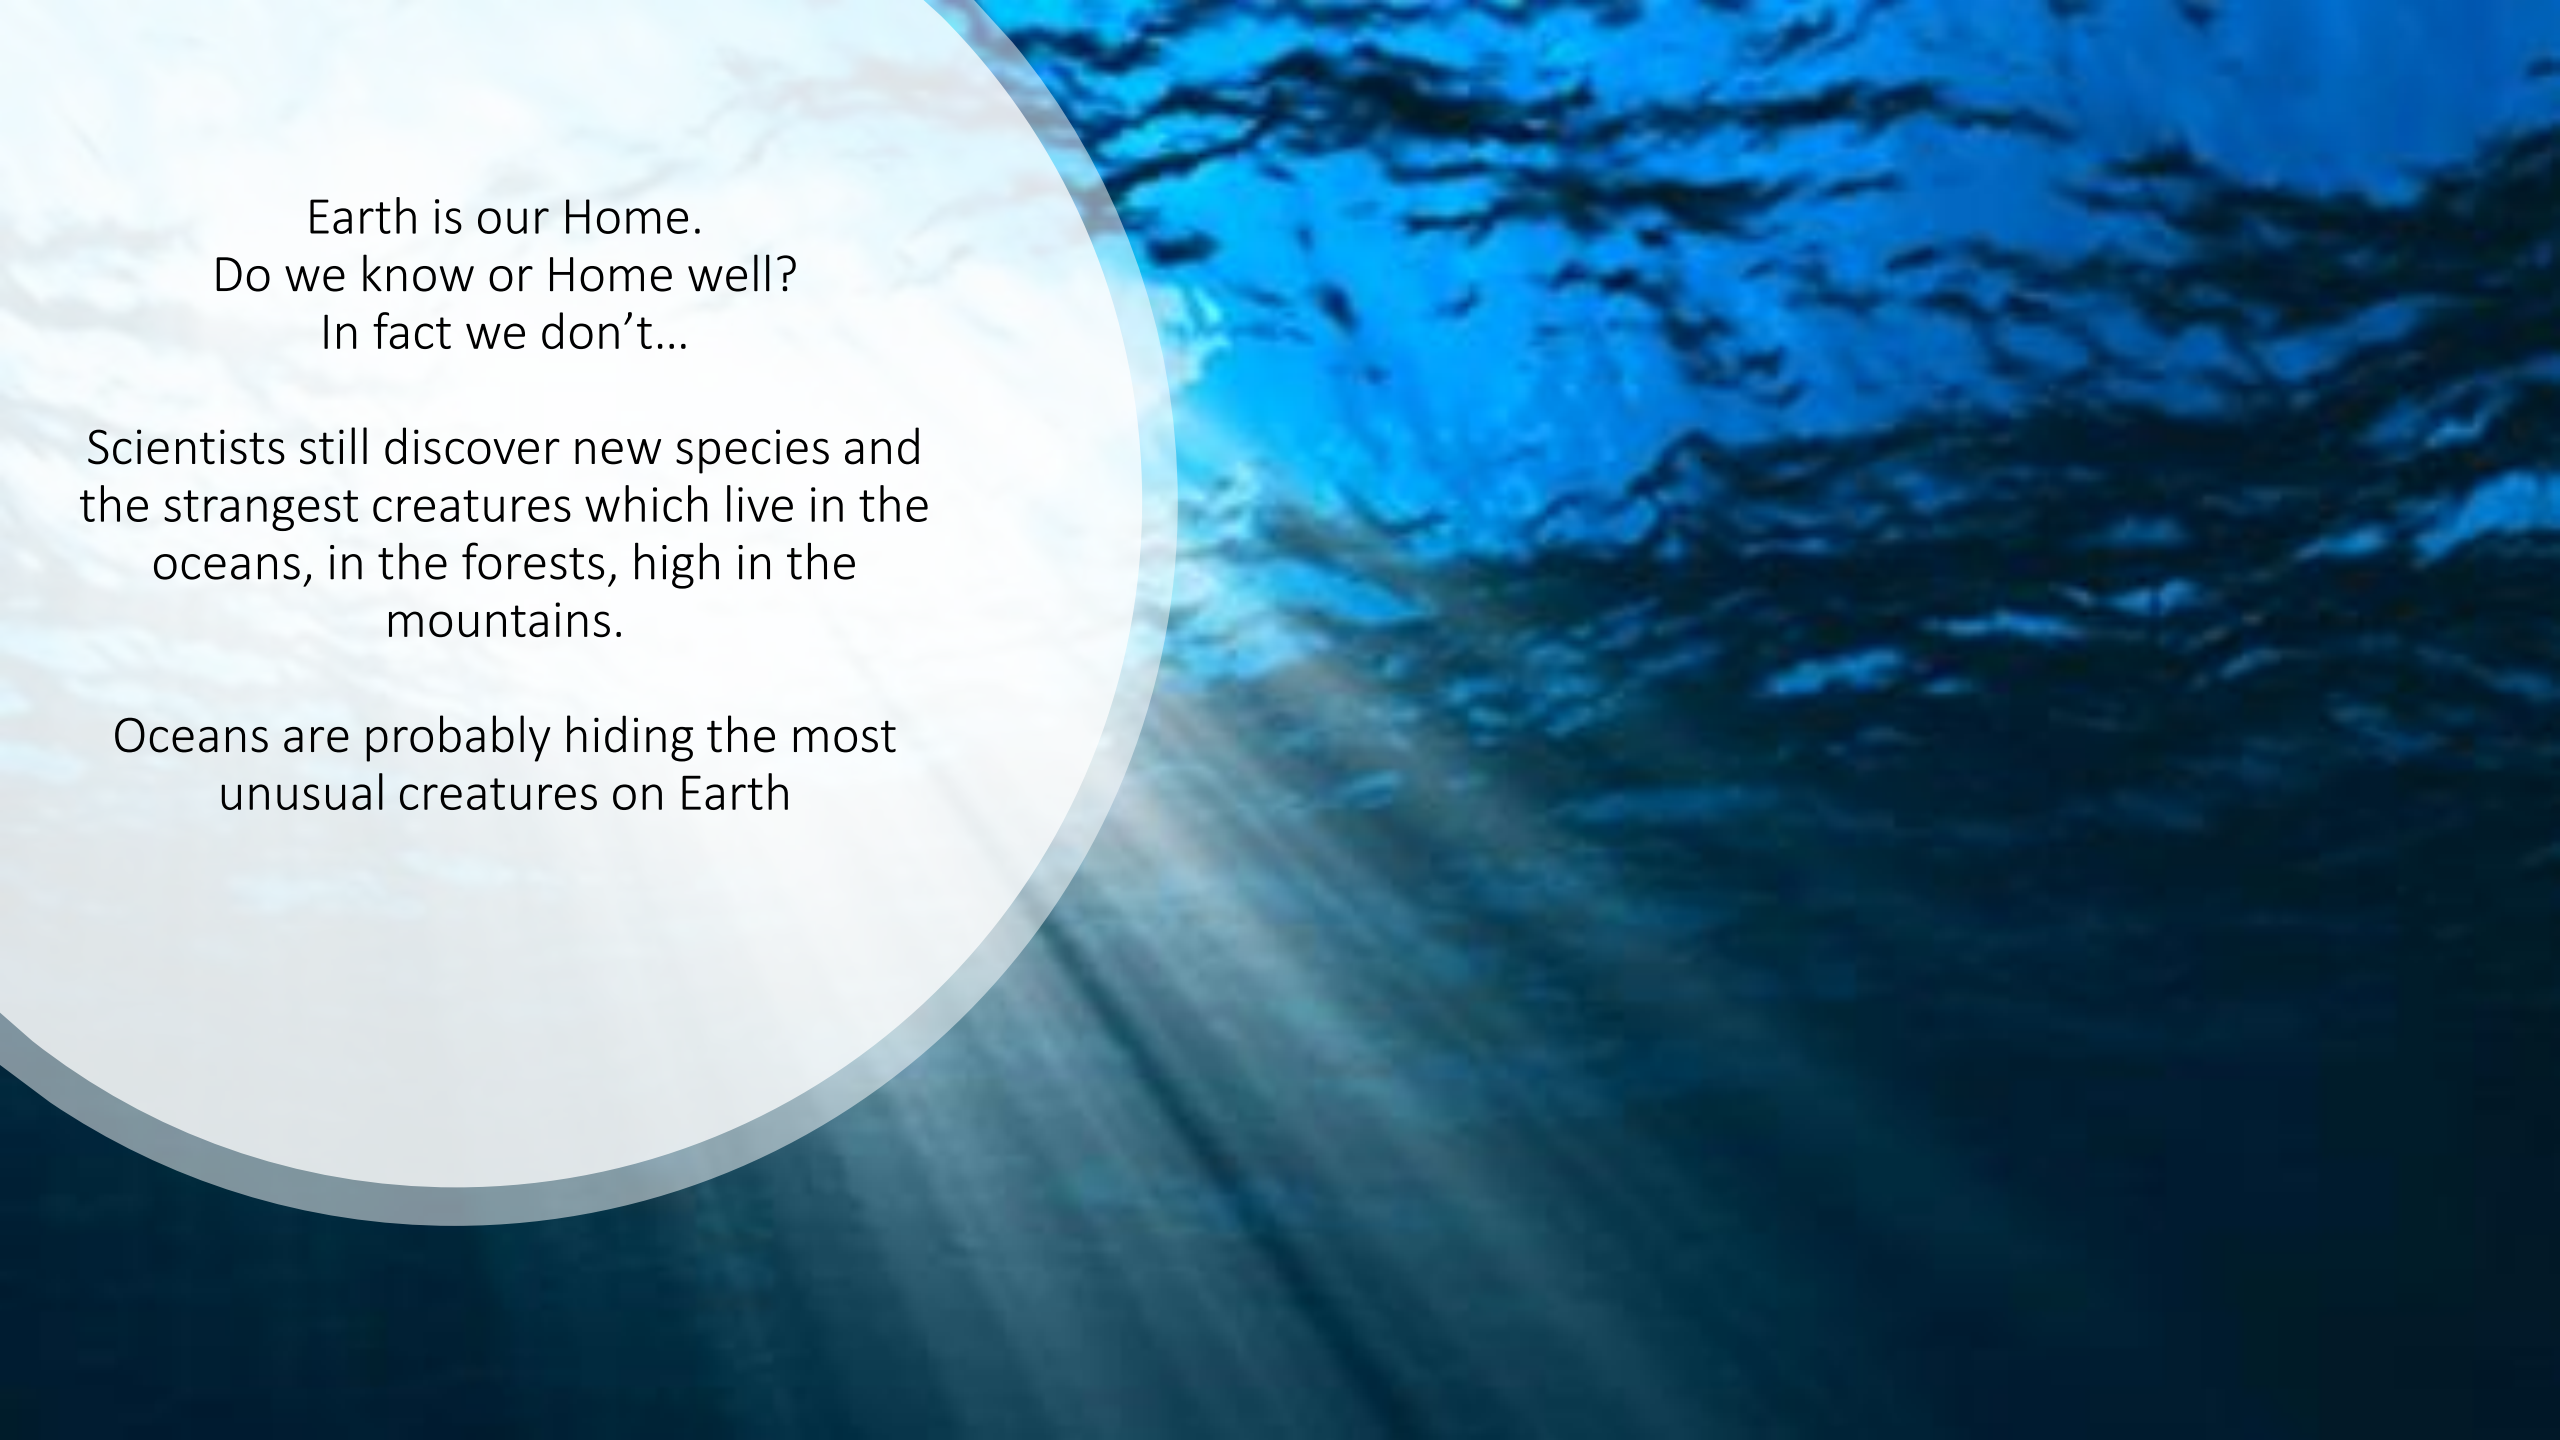

project by Alena Markunina

School 94, Grade 3A

A satellite night view of Earth showing city lights across the continents. A large white circular overlay is positioned on the left side of the image, partially obscuring the view of the Americas. The text is located within this white area.

The Goal of the project:
to collect facts about the strangest
creatures which leave on Earth

Earth is our Home.
Do we know our Home well?
In fact we don't...

Scientists still discover new species and
the strangest creatures which live in the
oceans, in the forests, high in the
mountains.

Oceans are probably hiding the most
unusual creatures on Earth

Deep under water there live creatures that look like aliens.

What would they tell
if they had IG profiles?

No swimming!

Walking!

Galapagos Islands

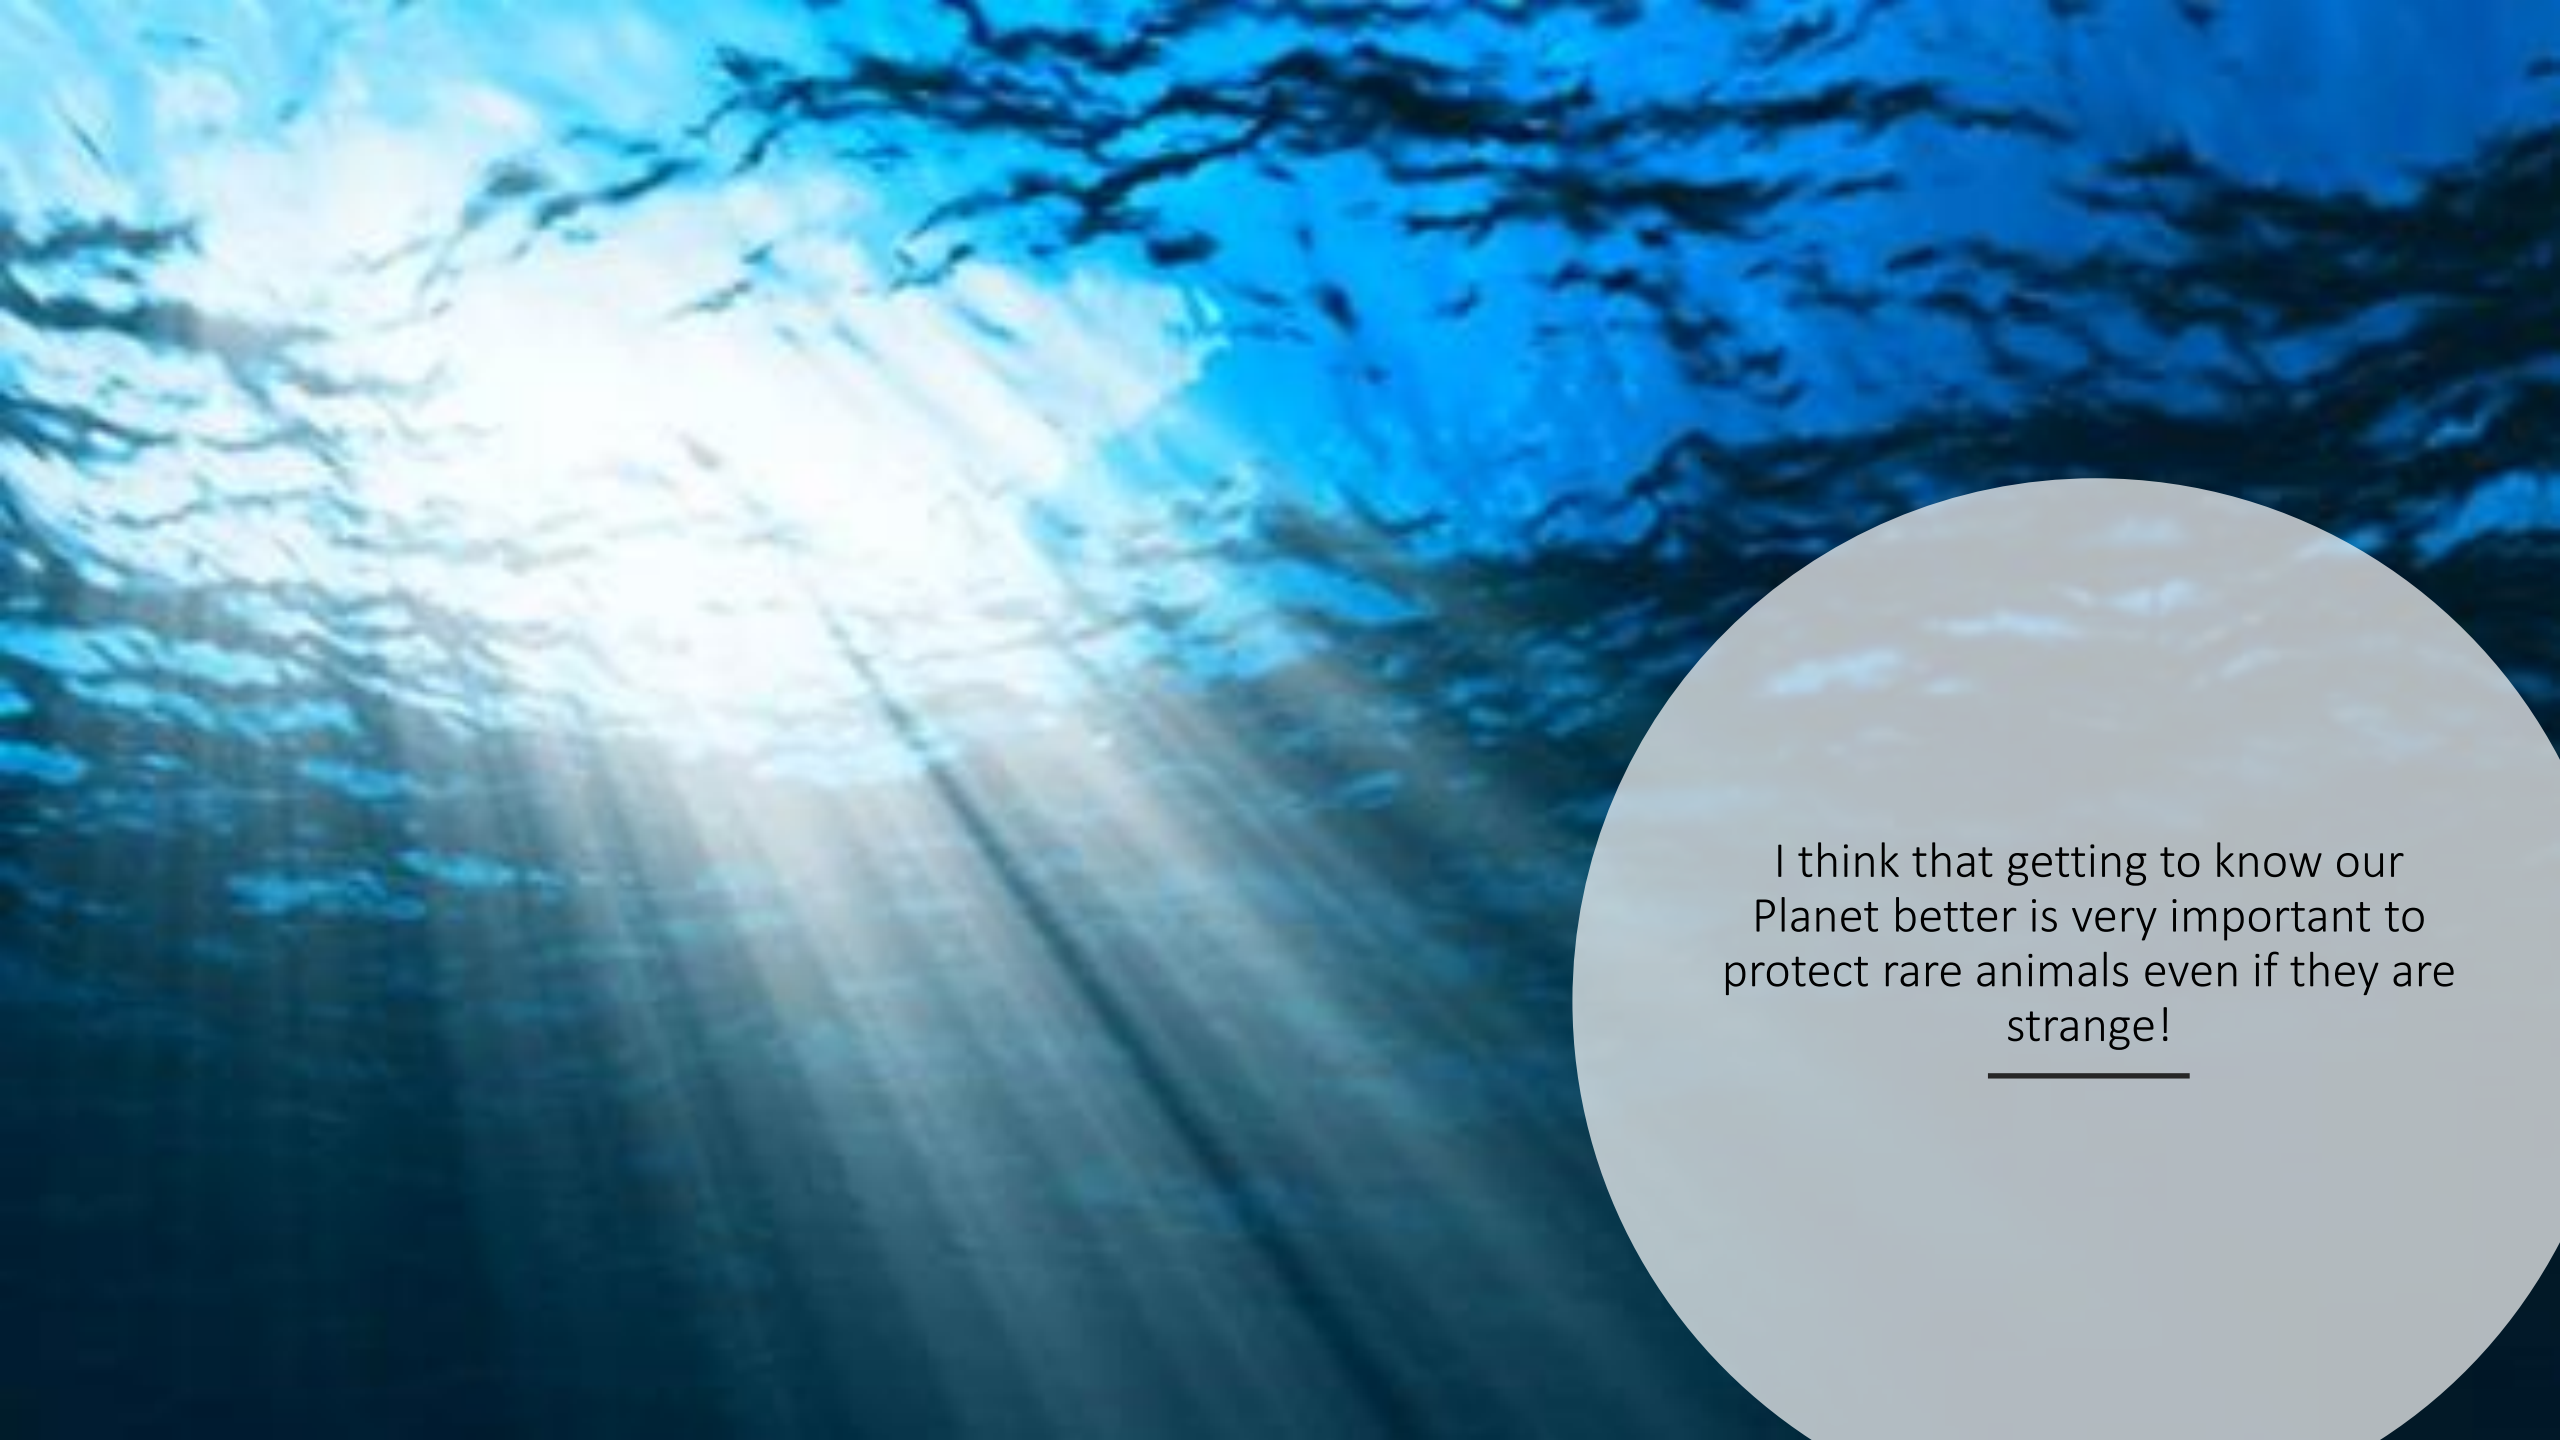

Red Lips

The background of the slide is an underwater scene. Sunlight rays are visible, filtering down from the surface, creating a shimmering effect on the water. The water is a deep blue color, and the overall atmosphere is serene and mysterious.

They are rare but they survived because:

- they live very deep under the water and don't have much enemies
 - they have good camouflage
 - they have super skills like regeneration

I think that getting to know our Planet better is very important to protect rare animals even if they are strange!

THANK YOU!
